Participants performed a series of maze tasks and Ravens Matrices tests under variable conditions, accompanied by music classified as either stimulating or sedative. The musical pieces chosen were both classical: Beethoven's Moonlight Sonata (sedative) and Vivaldi's Spring (stimulating). There were 60 participants in total (N=60) out of whom 37 were females and 23 male participants. These formed four different condition groups, each with 15 participants. The frustration (F) group, with unsolvable mazes, were played either sedative or stimulating music. Likewise, the Non-frustration (NF) group, with solvable mazes, was also played either of the music types. It was predicted that sedative music would have a more relaxing effect on participants after a frustration condition, compared to the stimulating music. Furthermore, as predicted, both music styles reduced anxiety levels, corresponding to better scores on the Ravens Matrices. The Ravens Matrices mean scores were higher for the frustration condition, indicating that frustrating situations can actually produce better IQ results if combined with the right music type. The findings indicate a strong connection between music and cognitive performance. 52 pp. Englisch.
